

OVERVIEW

The 5027 series are miniature crystal oscillator module ICs. The oscillator circuit stage has voltage regulator drive, significantly reducing current consumption and crystal current, compared with existing devices, and significantly reducing the oscillator characteristics supply voltage dependency. There are 3 pad layout package options available for optimized mounting, making these devices ideal for miniature crystal oscillators.

FEATURES

- Wide range of operating supply voltage: 1.60 to 3.63V
- Regulated voltage drive oscillator circuit for reduced power consumption and crystal drive current
- Optimized low crystal drive current oscillation for miniature crystal units
- 3 pad layout options for mounting
 - 5027A×, M× series: for Flip Chip Bonding
 - 5027B×, N× series : for Wire Bonding (type I)
 - 5027C×, P× series : for Wire Bonding (type II)
- Recommended oscillation frequency range
 - For fundamental oscillator**
 - Low frequency version : 20MHz to 60MHz
 - High frequency version: 60MHz to 100MHz
 - For 3rd overtone oscillator**
 - Low frequency version : 40MHz to 110MHz
- Multi-stage frequency divider for low-frequency output support: 0.9MHz (min)
- Frequency divider built-in (for fundamental oscillator)
 - Selectable by version: f_O , $f_O/2$, $f_O/4$, $f_O/8$, $f_O/16$, $f_O/32$, $f_O/64$
- -40 to 85°C operating temperature range
- Standby function
 - High impedance in standby mode, oscillator stops
- CMOS output duty level (1/2VDD)
- 50 ± 5% output duty
- 15pF output drive capability
- Wafer form (WF5027××)
Chip form (CF5027××)

APPLICATIONS

- 3.2 × 2.5, 2.5 × 2.0, 2.0 × 1.6 size miniature crystal oscillator modules

VERSION DISCRIMINATION INTERNAL COMPONENTS

The 5027 series device version is not determined solely by the mask pattern, but can also be determined by the trimming of internal trimming fuses.

- Version determined by laser trimming:

These chips are produced from a common device by the laser trimming of fuses corresponding to the ordered version, shown in table 1. These devices are shipped for electrical characteristics testing. Laser-trimmed versions are identified externally by the combination of the version name marking (1) and the locations of trimmed fuses (2).

- Version determined by mask pattern:

These chips are fabricated using the mask corresponding to the ordered version, and do not require trimming. Mask-fabricated versions are identified externally by the version name marking (1) only.

Since the 5027 series devices are manufactured using 2 methods, there are 2 types of IC chip available (identified externally) for the same version name. The identification markings for all 5027 series device versions is shown in table 2.

SPECIFICATIONS

Absolute Maximum Ratings

$$V_{SS} = 0V$$

Parameter	Symbol	Condition	Rating	Unit
Supply voltage range	V_{DD}	Between VDD and VSS	-0.5 to +4.0	V
Input voltage range ^{*1}	V_{IN}	Input pins	-0.5 to $V_{DD} + 0.5$	V
Output voltage range ^{*1}	V_{OUT}	Output pins	-0.5 to $V_{DD} + 0.5$	V
Storage temperature range	T_{STG}	Wafer form	-65 to +150	°C
Output current	I_{OUT}	Q pin	± 20	mA

*1. V_{DD} is a V_{DD} value of recommended operating conditions.

Note. Absolute maximum ratings are the values that must never exceed even for a moment. This product may suffer breakdown if any one of these parameter ratings is exceeded. Operation and characteristics are guaranteed only when the product is operated at recommended supply voltage range.

Recommended Operating Conditions

For Fundamental Oscillator

$$V_{SS} = 0V$$

Parameter	Symbol	Condition	Rating			Unit	
			min	typ	max		
Operating supply voltage	V_{DD}	$C_{LOUT} \leq 15pF$	1.60	-	3.63	V

Timing chart

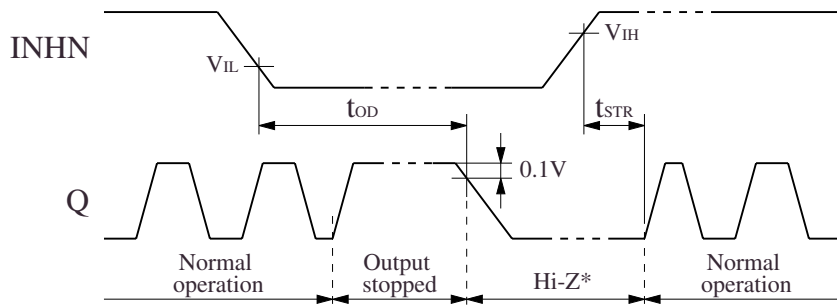

Figure 1. Output switching waveform

When INHN goes HIGH to LOW, the Q output goes HIGH once and then becomes high impedance.

When INHN goes LOW to HIGH, the Q output goes from high impedance to normal output operation after the oscillation start-up time " t_{STR} " (oscillation detector function).

*) The high-impedance interval in the figure is shown as a LOW level due to the $1k\Omega$ pull-down resistor connected to the Q pin (see "Measurement circuit 2" in the "Measurement Circuits" section).

Figure 2. Output disable and oscillation start timing chart

FUNCTIONAL DESCRIPTION

Standby Function

When INHN goes LOW, the Q output becomes high impedance.

INHN	Q	Oscillator
HIGH (or open)	Frequency output	Normal operation
LOW	High impedance	Stopped

Power-saving Pull-up Resistor

The INHN pin pull-up resistance R_{UP1} or R_{UP2} changes in response to the input level (HIGH or LOW). When INHN is tied LOW level, the pull-up resistance is large (R_{UP1}), reducing the current consumed by the resistance. When INHN is left open circuit, the pull-up resistance is small (R_{UP2}), which increases the input susceptibility to external noise. However, the pull-up resistance ties the INHN pin HIGH level to prevent external noise from unexpectedly stopping the output.

Oscillation Detector Function

The 5027 series also feature an oscillation detector circuit. This circuit functions to disable the outputs until the oscillator circuit starts and oscillation becomes stable. This alleviates the danger of abnormal oscillator output at oscillator start-up when power is applied or when INHN is switched.

MEASUREMENT CIRCUITS

Measurement cct 1

Measurement parameter: I_{DD} , I_{ST} , Duty, t_r , t_f

Note: The AC characteristics are observed using an oscilloscope on pin Q.

Measurement cct 4

Measurement parameter: V_{IH} , V_{IL}

V_{IH} : Voltage in V_{SS} to V_{DD} transition that changes the output state.
 V_{IL} : Voltage in V_{DD} to V_{SS} transition that changes the output state.
 INHN has an oscillation stop function.

Measurement cct 2

Measurement parameter: t_{OD}

XTN input signal: 1Vp-p, sine wave
 $C1$: 0.001µF C_{LOUT} : 15pF
 $R1$: 50Ω R_L : 1kΩ

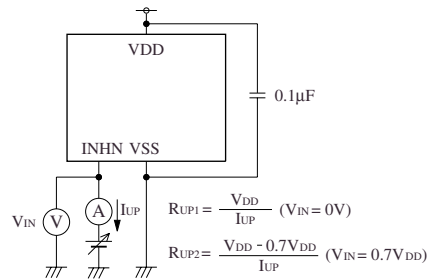

Measurement cct 5

Measurement parameter: I_Z

Measurement cct 6

Measurement parameter: R_{UP1} , R_{UP2}

Measurement cct 3

Measurement parameter: V_{OH} , V_{OL}

V_S adjusted such that $\Delta V = 50 \times I_{OH}$. V_S adjusted such that $\Delta V = 50 \times I_{OL}$.

XTN input signal: 1Vp-p, sine wave

TYPICAL PERFORMANCE (for fundamental oscillator)
