

OVERVIEW

The SM1350 series are single-chip high tone quality melody ICs, fabricated using NPC's Molybdenumgate CMOS process. Melodies are selected in serial or binary (parallel) mode, up to a maximum of 16 melody blocks. There are 4 sound generators incorporated to produce 4 kinds of output tone controlled by 16-tone data, making these ICs ideal for mechanical clocks and similar applications where high tone quality output is demanded.

FEATURES

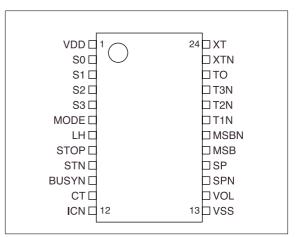

- Basic Functions
 - 4.0 MHz oscillator frequency
 - Power-save function
 - Oscillator stopped when no output
 - S0 to S3, MODE, LH pull-up resistors open
 - BTL or A-class outputs
 - Chattering prevention circuit (STN, STOP, S0 to S3)
 - 10-bit D/A converter
- Sound Generator Functions
 - DWS (dual wave synthesis) sound generators
 - 4 simultaneous sounds for 4 tones
 - G2 to F#7 note range
 - 16-tone programmable
- Melody Functions
 - Up to 16 programmable melodies (singly or in medleys)
 - 1024-step length (notes, rests, jumps, end codes)
 - Level hold/one-shot melody modes
 - Serial/binary (parallel) select modes
 - 4.8 to 605.6 tempo range in 127 steps
 - 12 rhythm values

• Ties and slurs programmable

- Ties and sturs programma
- Control Signal Outputs
 DUSYN signal LOW
 - BUSYN signal LOW during melody output
- CT signal output for external control
 2.4 to 5.5 V supply voltage
- 2.4 to 5.5 v supply
 Package
 - 24-pin SSOP (SM1350×××M)
- Molybdenum-gate CMOS

PIN DESCRIPTION

| Number | Name | I/O | State ¹ | Description ² | |
|--------|-------|-----|--------------------|--|--|
| 1 | VDD | - | - | Supply pin | |
| 2 | S0 | I | SU | | |
| 3 | S1 | I | SU | Binary select mode: Phrase select pins. | |
| 4 | \$2 | I | SU | Serial select mode: S0 and S1 control melody output. | |
| 5 | S3 | I | SU | | |
| 6 | MODE | I | SU | Melody select mode control. Binary mode when LOW, and serial mode when HIGH. | |
| 7 | LH | I | SU | Melody output mode control. One-shot when LOW, and level hold when HIGH. | |
| 8 | STOP | I | U or O | One-shot melody mode: Melody output stop control. Level hold melody mode: Invalid input. | |
| 9 | STN | I | U or O | Melody start control | |
| 10 | BUSYN | 0 | С | Busy output signal. LOW when a melody is output. | |
| 11 | СТ | 0 | С | External control pulse output | |
| 12 | ICN | I | U | Initialization clear input | |
| 13 | VSS | - | - | Ground pin | |
| 14 | VOL | I | - | Volume adjust control. Volume adjusted using an external resistor. | |
| 15 | SPN | 0 | Р | 9-bit D/A converter output in BTL output mode. VOL current output in A-class output mode. | |
| 16 | SP | 0 | Р | BTL output mode: 9-bit D/A converter output. A-class output mode: 10-bit D/A converter output. | |
| 17 | MSB | 0 | С | BTL output mode: Signed-bit output. HIGH when no melody is output. | |
| 17 | MOD | I | U | A-class output mode: BUSYIN input | |
| 18 | MSBN | 0 | с | BTL output mode: Signed-bit output. HIGH when no melody is output. A-class output mode: ENDN output. HIGH when no melody is output. | |
| 19 | T1N | I | U | | |
| 20 | T2N | I | U | Test signal inputs | |
| 21 | T3N | I | U | | |
| 22 | ТО | 0 | С | Test signal output. 62.5 kHz output when not in test mode. | |
| 23 | XTN | 0 | - | Oscillator output | |
| 24 | XT | I | - | Oscillator input | |

U = pull-up resistor connection, SU = pull-up resistor connection only when melody output starts, P = p-channel open drain, C = complementary output. U or O = pull-up resistance or open drain (master slice)
 BTL/A-class output mode is selected by mask option.

SPECIFICATIONS

Absolute Maximum Ratings

 $V_{SS} = 0V$

| Parameter | Symbol | Condition | Rating | Unit |
|---------------------|------------------|-----------|----------------------------------|------|
| Supply voltage | V _{DD} | | - 0.3 to 7.0 | V |
| Input voltage | V _{IN} | | $V_{SS}{-}0.3$ to $V_{DD}{+}0.3$ | V |

1.Oscillator start-up time = [time from when STN goes LOW to when TO goes HIGH] - 25.0 $\mu s.$ 2.The time taken for fast damping to reduce the envelope to 0 level.

FUNCTIONAL DESCRIPTION

Chattering Prevention

STN, STOP chattering prevention function

Standby Mode

The oscillator starts when STN goes from HIGH to LOW in standby mode. Input data is received and melody data output starts 81.9 ms after the oscillator starts if STN is LOW.

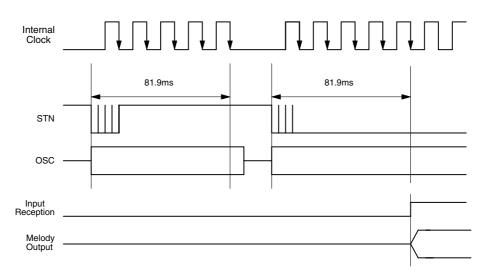

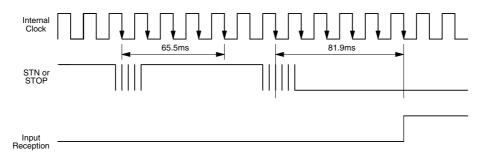

Figure 1. STN, STOP chattering prevention timing (standby mode) Note: Refer to the "TIMING DIAGRAMS" section to confirm melody timing specifics.

Oscillator starts running

After the oscillator starts running, input data is considered valid 81.9 ms after STN and STOP have last changed state. Input data is considered invalid for intervals less than 65.5 ms.

S0 to S3 chattering prevention function

In binary select mode, S0 to S3 are sampled in sync with the 15.26 Hz clock during level-hold melody output. The chatter prevention function compares the data sampled 65.5 ms after a data transition on S0 to S3 with the data sampled 65.5 ms before the data transition. If the 2 data samples are the same, then the data transition is considered invalid. However, if they are the not the same indicating a true transition has occurred, melody output stops and only restarts again after 2 consecutive identical melody select data samples occur.

Note that except for the "Select change retrigger [No]" master slice option and binary select mode with level hold output, the S0 to S3 chattering prevention circuit is disabled.

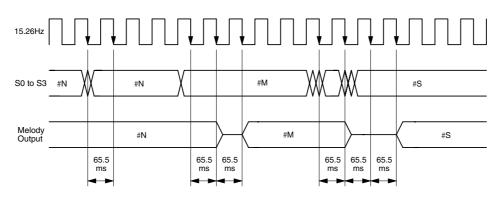

Figure 3. S0 to S3 chattering prevention timing

Note: Refer to the "TIMING DIAGRAMS" section to confirm melody timing specifics.

Initialization

When power on and ICN goes LOW, all pins and internal states are initialized to the states shown below. ICN initialization has priority over all other inputs.

- Output pins
 - SP, SPN : Open
 - MSB, MSBN : V_{DD}
 - CT : V_{SS}
 - BUSYN : V_{DD}
- Serial melody counter
- Reset to first melody (S0 to S3 all 0)
- Oscillator circuit Stopped

Melody Output Circuit

The volume control circuit comprises a P-channel current-summing D/A converter, a built-in constant-current source and an external variable resistor. The circuit is set for either BTL output or A-class output by master-slice option.

BTLoutput

The BTL output comprises a pair of 9-bit D/A converters and 4 external transistors $(2 \times NPN + 2 \times PNP)$ to drive a speaker.

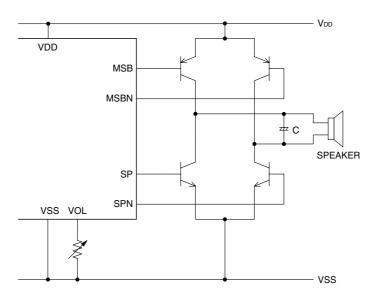

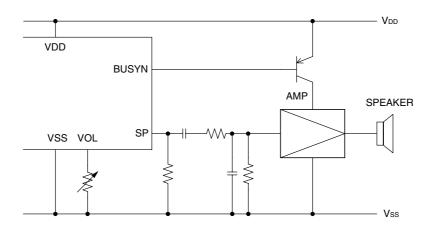

Figure 4. BTL output circuit

A-class output circuit

The A-class output circuit comprises a single 10-bit D/A converter with current output on SP. The D/A converter MSB is set ON immediately after the oscillator starts, and the current output that results is the center point above and below which the converter current output varies in response to the waveform amplitude. The SP output is current-to-voltage converted for connection to audio equipment or amplifiers. In A-class output mode, the 4 sound generator waveforms are time multiplexed, so an integrating circuit must be connected between SP and the amplifier to recover the signal.

Pin Functions

Binary select mode (MODE = LOW)

A melody (1 to 16) is selected according to the condition (H or L) of each 4 terminals (S0 to S3).

| S 3 | S2 | S 1 | S0 | ST | Melody | S3 | S2 | S1 | S0 | ST | Melody |
|------------|----|------------|----|----|------------|----|----|----|----|----|-------------|
| L | L | L | L | P | 1st melody | Н | L | L | L | Ł | 9th melody |
| L | L | L | Н | Ł | 2nd melody | Н | L | L | Н | Ł | 10th melody |
| L | L | Н | L | Ł | 3rd melody | Н | L | Н | L | Ł | 11th melody |
| L | L | Н | Н | Ł | 4th melody | Н | L | Н | Н | Ł | 12th melody |
| L | Н | L | L | ľ | 5th melody | Н | Н | L | L | Ł | 13th melody |
| L | Н | L | Н | P | 6th melody | Н | Н | L | Н | Ł | 14th melody |
| L | Н | Н | L | Ł | 7th melody | Н | Н | Н | L | Ł | 15th melody |
| L | Н | Н | Н | Ł | 8th melody | Н | Н | Н | Н | Ł | 16th melody |

H : VDD level, L : VSS level

Note: Don't select any address with no melody recorded.

One-shot melody output (LH = LOW)

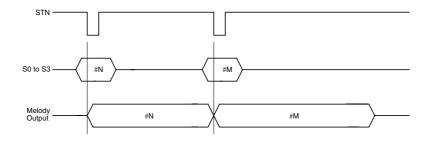

Figure 6. One-shot mode (binary select)

Note: Refer to the "TIMING DIAGRAMS" section to confirm melody timing specifics.

Level hold melody output (LH = HIGH)

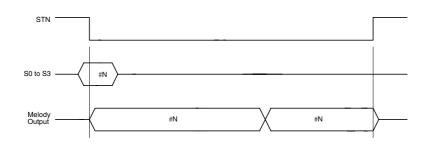

Figure 7. Level hold mode (binary select) with "Select change retrigger [No]" mask option Note: Refer to the "TIMING DIAGRAMS" section to confirm melody timing specifics.

If the "Select change retrigger [Yes]" mask option is selected, a new melody starts playing from the leading note when any of the S0 to S3 inputs changes state.

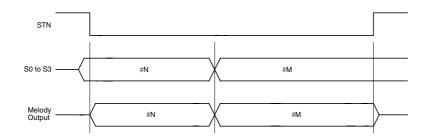

Figure 8. Level hold mode (binary select) with "Select change retrigger [Yes]" mask option

Note: Refer to the "TIMING DIAGRAMS" section to confirm melody timing specifics.

Serial select mode (MODE = HIGH)

In serial select mode, the next melody is selected by cycling through the melodies in the order $\#N \rightarrow \#N + 1 \dots \#N - 1 \rightarrow \#N$ when the STN input goes LOW. The number of melodies in the cycle is set by master-slice option. Note that when melody output is stopped using the STOP input, the melody-select counter increments.

One-shot melody output (LH = LOW)

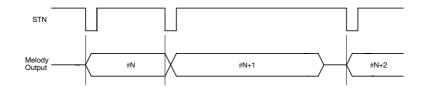

Figure 9. One-shot mode (serial select)

Note: Refer to the "TIMING DIAGRAMS" section to confirm melody timing specifics.

Level hold melody output (LH = HIGH)

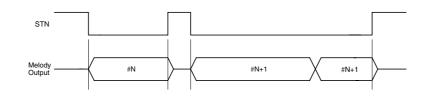

Figure 10. Level hold mode (serial select)

Note: Refer to the "TIMING DIAGRAMS" section to confirm melody timing specifics.

S0, S1 melody output control

The melody selection in serial mode is controlled by S0 and S1 as shown in the following table. When S1 is HIGH, S0 switches to a pull-up input configuration. The states of S0 and S1 are read in immediately after startup and does not change during melody output.

Table 1. S0, S1 resistor and melody counter

| S0 | S1 | Melody counter |
|------|------|--------------------------------------|
| LOW | × | Increments when melody output stops |
| HIGH | LOW | No increment |
| HIGH | HIGH | Increments when melody output starts |

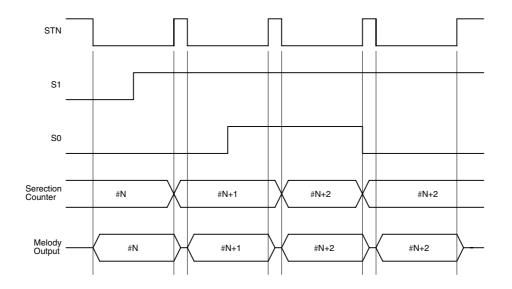

Figure 11. S0, S1 melody output control timing

Note: Refer to the "TIMING DIAGRAMS" section to confirm melody timing specifics.

One-shot mode repeat function

In one-shot melody mode, the output repeats the same melody while STN is LOW. When STN goes HIGH, the output continues until the end of the currently playing melody and then stops.

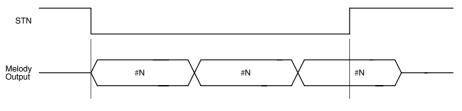

Figure 12. One-shot melody repeat timing

Note: Refer to the "TIMING DIAGRAMS" section to confirm melody timing specifics.

One-shot mode perpetual repeat function

If the score ROM end code is set to the jump code, the melody will continue to play continuously once oneshot mode starts.

STOP pin

One-shot output mode stops when STOP goes from HIGH to LOW. The STOP input is ignored in level hold output mode and is also ignored in one-shot mode when STN is LOW. Note that even when STOP is LOW, STN has higher priority.

CT pin

A pulse in sync with selected notes or rests is output on CT. There are 2 modes for the output pulses – pulse mode and hold mode.

Pulse mode

In pulse mode, a 16.4 ms pulse is output when a note or rest occurs for which the corresponding CT data in score ROM is set to 1.

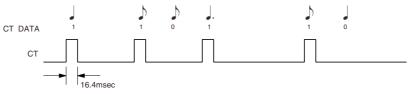

Figure 13. CT pulse mode output

Hold mode

In hold mode, the output pulse inverts when a note or rest occurs for which the corresponding CT data in score ROM is set to 1. The output goes LOW after the start of a melody and when jumping to the leading note of a melody.

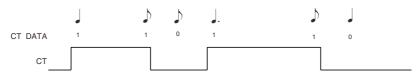

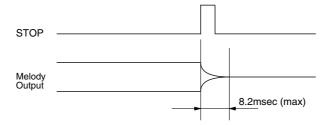

Figure 14. CT hold mode output

Fast Damping

When melody output stops, the D/A converter output amplitude does not fall to zero instantaneously, instead the output converges to zero within a maximum of 8.2 ms to prevent noise being generated. Also, when one-shot melody output mode is retriggered, melody output restarts after the fast damping interval.

Note: Refer to the "TIMING DIAGRAMS" section to confirm melody timing specifics.

Sound Generator

Synthesis mthod

The sound generators use the dual wave synthesis (DWS) method. The DWS method uses the envelope of 2 waveforms (main waveform and sub waveform) to synthesize the generated tone. Using this method makes possible high tone quality output that faithfully reproduces the tones of real musical instruments.

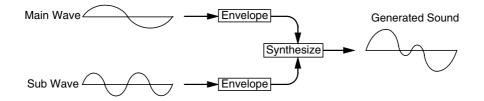

Figure 16.

Number of simultaneous sounds

The maximum number of tones that can be generated simultaneously is 4, making 4-part harmony

harmony

Generation possible (where each tone is derived from corresponding main and sub waveforms).

Sound range

The range of sounds covers 5 octaves from note G2 to F#7.

Waveform ROM

Waveforms are stored in a $10 - bit \times 128 - word \times 8 - waveform$ capacity waveform ROM.

Number of programmable tones

The maximum number of programmable tones is 16. Note that 2 similar tones which have different envelope settings are considered to be separate tones.

Built-in ROMs

The built-in ROMs comprise 3 types of ROM – waveform ROM containing waveform data, score ROM containing musical score data, and parameter ROM containing envelope and jump data.

Melodies

Number of melodies

The maximum number of program melodies is 16. Note that is the jump function is used to change the tone or tempo during melody output, then the maximum number of melodies reduces by the number of times the jump function was invoked.

Number of program steps

The maximum number of program steps that can be stored in score ROM (notes, rests, jump codes and end codes) is 1024.

Tempo

The basic quarter note tempo can be set in the range 4.8 to 605.6 in multiples of 4.8.

Note (rest) rhythm values

There are 12 note rhythm values and 13 rest rhythm values that can be used to construct a melody. Also, 2 or more notes can be combined using ties or slurs.

| | | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | A | В | С |
